                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip, in vitro as (anti)sense reagents, and (2) for production of a crombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in virto as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that
quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonuclectides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic, virucide, neuroprotective; nootropic; neuroleptic; murine, tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Murine oligonucleotide associated with tumour supression, SEQ ID 445.

```
The present invention relates to murine oligonucleotides (ACC62754-ACC68866), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Murine oligonucleotide associated with tumour supression, SEQ ID 1983.

```
ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration,
                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

The present invention relates to murine oligonucleotides (ACC62754-ACC8806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying and/or amplifying nucleic acid, e.g. as one component of agenc chip; in virco as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                              New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;

The present invention relates to murine our supression, true associated with tumour suppression, tumour reversion, which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that of pharmaceuticals for prevention and/or treatment of viral diseases that
                reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip; in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine;

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as recombinant models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or disease characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease can be used for diagnosis. Analysis of the expression of the nucleotides can be used for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. Or the complement, or corresponding RNA, of the conditions are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleotides are used as probes or primers for detecting, sense and antisense sequences, of nucleotides involved in tumour sense and antisense sequences, of nucleotides involved in tumour recombinant polypeptides, and to prepare transagenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzhehmer's disease or schizophrenia).
                                                                                                                                                                                                                                                                           cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss;

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as recombinant models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and only properties can be used for diagnosis and the containing models. The nucleotides can be used for diagnosis and the containing the containing the recombiner's disease or schizophrenia).

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence haring at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding NNA, of the nucleotides, The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and earlies ontaining the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections of diseases characterized by development of tumours
                                                                                                         cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and/or prognosis of these diseases. The nucleotides and polypeptides can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
Analysis of the expression of the nucleotides can be used for diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related

Tumour suppression/reversion associated nucleotide #5262.

```
fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. Or the complement, or corresponding RNA, of the complement, or corresponding RNA, of the nucleotides are used as probes or primers for detecting, identifying and/or amplifying nucleotides in tumour censes and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce cecombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognessis of these diseases. The nucleotides can an polypeptides can all or prevention and polypeptides can all or prognessis of these diseases. The nucleotides can and polypeptides can all or preventions and polypeptides can al

The invention relates to an isolated human GTP-activator protein for Rablike GTPase (GAPN) polypeptide (I), a sequence having 65% identity to (I), a sequence in which at least 95% of deviations from (I) are conservative substitutions, or a fragment of at least 8 contiguous amino acids of (I). The polypeptide is useful for identifying a specific binding partner for itself, by contacting the polypeptide in vivo to a potential binding partner and determining if the polypeptide in vivo to a potential binding partner and determining if the polypeptide binding partner binds to the polypeptide (I) and a nucleic acid encoding the polypeptide (II) are useful for diagnosing or monitoring a disease caused by altered expression of GAPN, by determining the level of expression of GAPN, by determining the level of expression of GAPN in a sample of mucleic acids or protentins that derives from a subject companie of (I) is useful for treating or preventing a disorder corresponds of (I) is useful for treating or preventing a disorder associated with increased expression or activity of GAPN, and an ansociated with increased expression or activity of GAPN, and an associated with increased expression or activity of GAPN, and an associated with increased expression or activity of GAPN, and an anormal expression of an associated with increased expression or activity of GAPN, and an anormal and an apprehens. (II) is useful to raise antibodies that specifically are recognize GAPN proteins. (II) is useful to raise antibodies that specifically crossing and as hybridization probes to detect. characterize and quantify GAPN nucleic acids in and isolate GAPN nucleic acids from both represents a 17-mer oligonucleotide spanning the GAPN NAN sequence.
                                                                                                                                                                                                                                                                                                                                                                                              Novel human GTP-activator protein for Rab-like GTPase and polynucleotide encoding the protein, useful for diagnosing, treating or preventing disorders associated with increased expression or activity of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The invention relates to an isolated human GTP-activator protein for Rablike GTPase (GAPN) polypeptide (I), a sequence having 65% identity to like GTPase (GAPN) polypeptide (I), a sequence having at least 95% of deviations from (I) are conservative substitutions, or a fragment of at least 8 contiguous amino acids of (I). The polypeptide is useful for identifying a specific binding partner for itself, by contacting the polypeptide in vivo to a conservative binds partner and determining if the polypeptide binding partner binds to the polypeptide (I) and a nucleic acid encoding the comparison of cappending of GAPN, by determining if the polypeptide binding partner binds to the polypeptide (I) and a nucleic acid encoding the comparison of GAPN in a sample of nucleic acids or proteins that derives from a subject suspected to have the disease, alterations from a normal level of suspected to have the disease, alterations from a normal level of cappending diagnostic and/or monitoring information. (I), (II) or associated with decreased expression or activity of GAPN, and an antagonist of (I) is useful for treating or preventing a disorder associated with increased expression or activity of GAPN, and an antagonist of (I) is useful for treating or preventing a disorder capponist of (I) is useful for treating or preventing a disorder associated with increased expression or activity of GAPN (all claimed).

(I) is useful as immunogen to raise antibodies that specifically capponents and as hybridiation probes to detect, characterize and quantify GAPN nucleic acids in and isolate GAPN nucleic acids from both genomic and transcript-derived nucleic acid samples. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 17 BP; 1 A; 7 C; 6 G; 3 T; 0 U; 0 Other;

AAT30557 standard; DNA; 19 BP. (first entry) 11-FEB-1997 AAT30557; RESULT 1145 AAT30557 

Probe JH3 for HNK-20 Jheavy chain coding sequence.

Antibody, HNK-20; variable heavy chain; hybridoma; murine; IgA; mouse; F glycoprotein; respiratory syncytial virus; RSV; constant region gene; chimeric antibody; isotype-switched antibody; therapy; infection; human; pneumonia; bronchiolitis; animal; polymerase chain reaction; probe; ss. Synthetic

AATJ0546-T30558 represent probes for the J chains of an antibody produced by the hybridoma cell HNK-20. AATJ0555-T30558 represent probes for the Upeav chain of the HNK-20 antibody. HNK-20 is a murrine hybridoma cell into, that produces IgA specific for the F glycoprotein of respiratory into that produces IgA specific for the F glycoprotein of respiratory syncytial virus (RSV). The variable chain coding sequences (see AATJ0456-T30458) were isolated using primers specific for the 5' untranslated region of the variable region, and for the intron downstream of the creation of the variable region, and for the intron downstream of the creation genes, for the production of chimearic and isotype-switched antibodies. The antibodies are useful in the treatment and diagnosis of infection by RSV, such as pheumonia and bronchiolitis, in humans and antibodie and producing tragments that have to be adapted for recombinant antibody expression. Also, by using the genomic DNA, no crecombinant antibodies produced from the encoded protable region is required chimeric antibodies produced from the encoded protable region; is a required continent antibodies produced from the encoded protable region is required. DNA encoding variable region of antibody HNK-20 - for treating respiratory syncytial virus infection. Example; Page 55; 75pp; English. 94US-00348548. 95WO-US015716 . ن Kraehenbuhl WPI; 1996-286826/29. (ORAV-) ORAVAX INC. 01-DEC-1995; 01-DEC-1994; 06-JUN-1996. Berdoz J,

```
human adenosine A1 receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothicate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptors is a member of the G-protein coupled family of cell surface receptors that have 7-protein coupled family of cell surface receptors that have 7-protein conditions associated with bronchoconstriction and/or lung inflammation in humans or other animals e.g. asthma, pulmonary disease, allergy, emphysema and cystic fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the
                                                                                                                                                                                                                                                                                                        Treating respiratory disease with antisense sequences directed against adenosine or bradykinin receptors - with localised delivery to the respiratory system, suitable for long term treatment of asthma, adult respiratory distress syndrome etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense oligonucleotide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This oligonucleotide comprises the Bsu site (nucleotides 8887-8902) of Sindbis virus. Defective helper structural protein constructs of the invention can contain an intact or deleted form of this sequence. Such constructs can be used in the construction of alphavirus packaging cell lines with 'hybrid' structural proteins comprising sequences from other alphaviruses or togaviruses. The present invention provides alphavirus-consequences with reduced inhibition of cellular macromolecular synthesis. Alphavirus vector constructs, replicons and eukaryotic layered vector initiation systems of the invention are used: (i) to deliver a selected heterologous sequence, particularly in gene therapy for treatment of a wide range of infections, cancers, and autoimmune causes, or to regulate the immune system; (ii) as vaccines; (iii) to inhibit pathogens; and (iv) to express heterologous products (therapeutic proteins, ribozymes, and antisense sequences). Since the modified vectors of once cause significant inhibition of host cell biosynthesis, they can correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       °,
                                                                                                                                                                                                                                                                                                                Nucleic acid comprising altered alpha-virus non-structural protein gene -
useful for generating expression cassettes for production of recombinant
proteins in vertebrate or insect cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The specification describes antisense oligomucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
con-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 6'-end, the 3'
conditions or mixtures. The antisense oligomucleotides may be derived
from sequences AAX5512-74. These multiple target oligomucleotides
conditions or mixtures. Typical diseases and conditions are those
cassociated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
catute asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
cature asthma, allergies, asthma, impeded respiration, respiratory
distress (COPD), and cancers such as leuvenias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, melanoma, hepatic metastases, as
the lank as all types of cancers which may metastasize or have metastasized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Alphavirus; infection; cancer; autoimmune disease; gene therapy; vaccine; packaging cell line; hygromycin resistance; selectable marker; PCR; primer; ss.

This oligonucleotide comprises the Bsu site (nucleotides 8887-8902) of Sindbis virus. Defective helper structural protein constructs of the invention can contain a intact or deleted form of this sequence. Such constructs can be used in the construction of alphavirus packaging cell lines with hybrid structural proteins comprising sequences from other alphaviruses or togaviruses. The present invention provides alphavirus-capthesis. Alphavirus vector constructs, replicons and eukaryotic layered vectors with reduced inhibition of cellular macromolecular synthesis. Alphavirus vector constructs, replicons and eukaryotic layered vector initiation systems of the invention are used: (i) to deliver a selected heterologous sequence, particularly in gene therapy for treatment of a wide range of infections, cancers, and autoimmune treatment of a wide range of infections, cancers, and autoimmune continuity in packages, or to regulate the immune system; (ii) as vaccines; (iii) to diseases, or to regulate the immune system; (ii) as vaccines; (iii) to proteins, ribozymes, and antisense sequences). Since the modified vectors on out cause, significant inhibition of host cell biosynthesis, they can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, adenosine receptor; low adenosine antisense oligonucleotide; phosphorothioate; impaired respiration; inflammation; allergy; allergy; disease; bronchoconstriction; inhibitor; antiinflammatory; antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemia; lymphoma; carcinoma; metastasis; ss.

```

The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nuclect acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergies, and/or antiathmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating impeded respiration, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including the east and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA2313 to AAA3512 represent the nucleotide sequences given in the sequence listing from the present the invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:1 to 186 (AAA33233 to AAA33922) are specifically claimed ONS from the present invention. N. B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence

Novel composition for treating or preventing e.g. cardiopulmonary and

renal injury.

Claim 17; Page 30; 252pp; English

The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine Aza receptor agonist (Ia), or an oligonucleotide (Ib), containing less than 15% adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. 5. or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding and non-coding sequences), or to all has Al, Azb or A3 agonist activity or Aza antagonist activity for at least no agonist activity or Aza antagonist activity or at least no aponist activity at this receptor). (I) may be a mixture of (Ia) and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine receptor-mediated cardiac, lung and/or renal damage or failure farming and/or renal damage or failure pulmonary disease; cardiopulmonary hypoxia associated with administration of stress-test agents, particularly where such conditions are associated with acute inflammation. AAA02717, AAA02719, AAA02712 and AAA02723 to AAA03715 represent specifically claimed phosphorothioate antisense oligonucleotides for use in the composition of the present invention. AAA02718, AAA02720, AAA02722 and AAA03716 to AAA03710 represent invention. phosphorothioate oligonucleotides used in the exemplification of the administration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive present invention

consumerectures the a is replaced by a controlled of all controlled by bronchooliator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligomucleotides and (1) can be used to down-regulate the expression and or activity of target polypeptides associated with expression and or activity of target polypeptides associated with controlled procession and or activity of target polypeptides such as stimulating and cativating peptide factors and antiphodies, such as stimulating and chemokines, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, cytokines and chemokine receptors, adenosine receptors, prokaine and chemokine receptors, and peripheral nervous and non-nervous system creceptors, and peripheral nervous and non-nervous system peptide cransmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligomucleotides and malignancy associated proteins. The antisense oligomucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy (ies) and/or condition entered by a sessociated with a disease or condition and processes or conditions.
                                                                                                                                                                                                                                                                                                                                                                           Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CP), allergic fibritis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary desase (COPD) pulmonary transplantation respection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

flavivirus having a genome with a 3' stem-loop structure substitution, and being defective for replication in an arthropod vector that transmits flavivirus to humans. The genome is selected from a first flavivirus and the 3' stem-loop structure from a second flavivirus, where the first flavivirus and plavivirus is different from the second. For example the first flavivirus may be Dengue virus type 2 (DBN2) and the second flavivirus may be West NN1e virus type 2 (DBN2) and the second flavivirus may be West vaccine for treating flavivirus-induced infections, particularly dengue fever or dengue haemorthagic fever/shock syndrome. The present sequence represents a part of the MY genome used to construct a mutant replication defective flavivirus in the examples of the present invention. (Updated on 07-MUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; allele-specific base detection; primer extension reaction; base-specific detection primer; allele-specific primer extension assay; AS; high throughput; single nucleotide polymorphism; SNP analysis; mutation detection; genetic variation; allele-specific extension; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                   stem-

The present invention relates to a method for detecting a base at a predetermined position in a nucleic acid molecule. The method comprises performing primer extension reactions using base-specific detection primers, each being specific for a particular base at the predetermined primers, each being specific for a particular base at the predetermined position. The allele-specific (As) primer extension assay method of the invention is useful for detecting an allele-specific base at a predetermined position in a nucleic acid molecule, for high throughput single nucleotide polymorphism (SNP) analysis, and for detecting mutations and genetic variations. The new method solves the deficiencies of previous methods by providing a method of allele-specific extension that allows accurate discrimination between matched and mismatched configurations, as well as reducing or eliminating false positive results observed in prior art. The use of two allele-specific primers increases the sensitivity by a factor of two because signals of two extensions are between the examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting a base at a pre-determined position in a nucleic acid molecule, comprises performing primer extension reactions using base-specific detection primers in the presence of a nucleotide-degrading enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 16 BP; 2 A; 2 C; 10 G; 2 T; 0 U; 0 Other;

first active agent comprising an oligonucleotide antisense to the intratactive agent comprising an oligonucleotide antisense to the intiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignamic is useful for treating or preventing a respiratory, lung or malignam disease or condition, also antiinflammatory steroid in a subject, for reducing levels of committed and sensitivity to adenosine. Treducing levels of the section bronchodilation, increasing levels of ubiquinone or lung suffactant in a subject, stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed section, in the was obtained in electronic format directly from WIPO Pharmaceutical composition for treating allments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or Katz E, Pabalan J, Aguilar D; ٠. 3.9%; Score 11.2; DB 1; Length 16; 81.2%; Pred. ```
The invention relates to a method of making a selected polypeptide which comprises introducing into a cell a eukaryotic layered vector initiation system, maintaining the cell for expression of the selected polypeptide and expressing the selected polypeptide. The eukaryotic layered vector initiation system comprises a 5' promoter that directs synthesis of alphavirus RNA, a bromoter that directs synthesis of transcription of alphavirus RNA, a bucleic acid that operably encodes all four alphaviral nonstructural proteins, a heterologous nucleic acid sequence encoding the selected polypeptide and an alphavirus RNA polymerase recognition sequence. The alphavirus is Sindak virus, Semliki Forest virus, Venezuelan equine encephalitis virus or Ross River virus. The method is useful for making a selected polypeptide. The present sequence represents a Sindbis virus pcr primer.
                                                                                                                                                                                                                                                                                                                                                                                        Making a selected polypeptide comprises introducing into a cell a eukaryotic layered vector initiation system, maintaining the cell for expression of the selected polypeptide and expressing the selected

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a eukaryotic layered vector initiation system, comprising a mucleic acid sequence encoding all four alphaviral comprising a mucleic acid sequence encoding for nonstructural protein 2, such that when the altered sequence encoding for nonstructural protein 2, such that when the altered sequence is operably incorporated into an RNA vector replicon, the time required to reach 50% inhibition of callular macromolecular synthesis in calls is increased, as compared to an RNA vector replicon having a wild-type alphavirus compared to an RNA vector initiation system comprises a 5' promoter which directs synthesis of alphavirus RNA in vivo from cDNA, a 5' which directs synthesis of alphavirus RNA in vivo from cDNA, a 5' sequence which directs transcription of alphavirus RNA, a mucleic acid sequence which operably encodes all four alphavirus RNA, a mucleic acid sequence which operably encodes all four alphavirus nostuctural content of tract. The eukaryotic layered vector initiation system is cuseful for stimulating an immune response within a vertebrate, for protein expression and gene therapy. The system exhibits reduced, delayed or no inhibition of callular macromolecular synthesis, thus permitting its use for protein expression and gene therapy with reduced, delayed or no development of cytopathic effects or call death. The invention relates to treating viral infection or reactivation comparising contacting an individual with an antagonist of the interaction comparising contacting an individual with an antagonist of the interaction. Edetween a Herpers Simplex virus (HSV) polymucleotide sequence appearing as ADD07153 and interferon regulatory factor-1 (IRF-1, a transcription isolated HSV polymucleotide comprising ADD07153, a composition comprising a HSV polypeptide involved in viral infection or reactivation, screening for compounds capable of inhibiting specific binding of IRF-1 to IRF-1: FBP (undefined) complex, a compound capable of agonising of IRF-1: TE-1: FBP (undefined) complex, a compound capable of agonising of IRF-1: TE-1: FBP (undefined) complex, a compound capable of agonising of antagonising any compound in IRF-1 and/or interferon consensus sequence. The method is useful for treating infection or reactivation caused by Herpes virus, e.g., HSV-1 or HSV-2 infections and for cytomegalovirus, Epstein Barr virus and zoster virus infection. The HSV polypeptide and polynucleotides may also be useful as the individual vaccines. The present sequence represents an identified viral
                                                             Treating infection or reactivation caused by Herpes virus comprises using antagonist of Herpes Simplex virus polynucleotide sequence and interferon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 16 BP; 4 A; 3 C; 6 G; 3 T; 0 U; 0 Other;

Preparing a humanized antibody for preventing or treating hepatitis

antibody comprising selectining a specificity determining a numenised antibody comprising selectining a specificity determining region (CDR) of murine monoclonal antibody heavy chain and light chain variable regions, and gratefing the SDR to at least one of the corresponding amino acid sequences into human settines of the corresponding amino acid sequences into human corresponding acid sequences into human antibody variable regions. Also described: (1) a humanised antibody prepared according to CDR-grafting method, which suppresses the human anti-mouse antibody heavy chain for the heavy chain variable region of hepatitis B virus (HBV) pre-SI antigen, or the humanised antibody light chain for the light chain variable region of HBV pre-SI antigen, or the humanised antibody light chain for the light chain variable region of HBV pre-SI antigen, of HBV pre-SI antigen, (3) an expression vector phurkal27HC or pdCWV-dhfrC-HWKR127 comprising the DNA described above for expressing the humanised antibody has antibody, and (3) conformation of the humanised antibody and vector of (3); (5) a Chinese hamster ovary (CHO) cell line CHO/HWKR127 (Accession Number: KCTC 1019BBP) producing the humanised antibody; and (6) a composition for preventing or treating HBV infection, comprising the humanised antibody has antihilammatory. 0 hepatotropic and virucide activities, and can be used in gene therapy. The composition and method are useful in preventing or treating hepatitis B virus infection. The present sequence represents a PCR primer for a human heavy chain gene CH1 domain, which is used in an example from the virus infection comprises grafting a specificity determining residue of murine monoclonal antibody to the amino acid sequences in human antibody Gaps Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine; present invention describes a method for preparing a humanised 0; 3.9%; Score 11.2; DB 1; Length 16; 81.2%; Pred. The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (S1, ABBB3999), a sequence having 65% sequence of dentity to (S1), as equence central procession of the sequence comprising at least 8 contiguous amino acids. C fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene product that functions as an adaptor protein that interacts with Rho family small GTPsaces as well as downstream components of the signal transduction pathway. (I) is useful as contiding partner. (I) and mucleic acids (II) for identifying a specific binding partner. (I) and mucleic acids (II) c encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and cruseful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating care useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of printed specification, but is based on sequence information supplied to bring the by the Buropean Patent Office
                                                                                                                                                       Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine;

the invention transce to an experience of 730 anthough protein 1 (POSHI 1) polypeptide (1), comprising a sequence of 730 anthough a caids (S1, ABB83999), a sequence having 65% sequence identity to (S1), acids (S1, ABB83999), a sequence having 65% sequence identity to (S1), acids (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. C fragment of the sequences comprising at least 8 contiguous amino acids. C daptor protein that interacts with Rho family small GTPaese as well as deposite that interacts with Rho family small GTPaese as well as downstream components of the signal transduction pathway. (I) is useful c for identifying a specific binding partner. (I) and nucleic acids (II) c caused by altered expression of human PoSHL1 including diagnosing and creating cancer, they useful in the development of vaccines and (II) is treating cancer, they useful in suseful for constructing microarrays which are useful in measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of printed specification, but is based on sequence did not form part of the printed specification, but is based on sequence information supplied to berwent by the European Patent Office
                                                                                                                                                                                                                                Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated SH3 domain (POSH)-like signalling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .,
                                                                                                                                                                                                                                                                                                                Example 2; SEQ ID NO 1117; 60pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Beta-6; BTE2F; BTE3F; B1F; B2R; B3R; cell surface receptor; polymerase chain reaction; PCR; amplify; cDNA; ss.

The sequence MP2 is an example of a probe contg. DNA complementary to nucleic acid of Mycorrhiza fungi. The probe specifically binds to a segment of the 18S rRNA of the RNA-encoding DNA of Mycorrhiza fungi. Such a probe is useful for the detection of Mycorrhiza fungi, esp. that of Tricholoma matsutake or Lyophyllum shimeji, and for detection of rooting or growth of hypha of Mycorrhiza to a host plant, e.g. pine. See also AAQ50404-14

Oligo:nucleoside compounds for cleaving RNA - having a sequence that is complementary to a target nucleic acid strand and a non-complementary portion.

Disclosure; Page 93; 109pp; English.

This invention describes a novel oligonucleoside compound for hybridising to a target nucleic acid strand. The oligonucleoside comprises (a) an oligonucleoside sequence that is complementary to a target region or subregion of the target nucleic acid strand and (b) a portion that is non-complementary to a target site in the target region or subregion such that, when the oligonucleoside compound is hybridised to the target trand, or abase group at the site is oriented away from an inter-strand orientation. The oligonucleoside and combinations are used for inhibiting production of a selected protein in a cell by effecting cleavage at a site in a target region of cellular RNA that codes for the selected protein. They can be used for treating a condition in a mammal that is caused by the production of a selected protein. The oligonucleosides are target—mRNA-specific and can be used against manA specific to a target and can be used against manA specific to a can be used against manA specific to a particular disease state. They are relatively harmless to non-targeted nucleic acid. The non-complementary unit enhances internucleotidy! bond

Tracz D,

of human ICE were isolated

novel isoforms (AAW00993-96)

```
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA had do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arrhritis, asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)
                                                                 Ribozymes having modified bases and methods for producing them - for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer ICE-RT (AAT38208) is derived from the 3' untranslated sequence of human interleukin-1 beta converting enzyme (ICE). It was used to produce CDNA from poly-A+ RNA of the human T-cell line Unrkat and from total RNA of the human monocyte cell line THP-1. The CDNA was subsequently amplified (see also AAT38209-10) and cDNA clones (AAT38204-07) coding for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Iso:forms of interleukin 1 converting enzyme and related DNA - useful to identify iso:form inhibitors which can be used as anti-inflammatory and anti-apoptotic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Interleukin-1 beta converting enzyme; ICE; isoform; inhibitor;

The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angloplasty,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents the preferred target sequence for an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human c-myb sequence at the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme target sites to using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Arthritic condition; graft tolerance; immune response; target; cleavage; hammerhead ribozyme; hairpin ribozyme; human; rabbit; mouse; collagenase; stromelysin; synovial membrane; joint; arthritis; osteoarthritis;

The present invention describes a novel enzymatic nucleic acid (ENA)

chaving a hammerhead motif (HM) comprising: (i) at least 5 ribose residues

chaving a lammerhead motification at position 4 of the ENA; (iii) at least

cental-O-methyl modifications; and (iv) a 3'-end modification. The ENA's

con inhibit collagenase and stromelysin production in the synovial

cental collagenase and stromelysin production in the synovial

cental posteoarthritis or rheumatoin arthritis. The ENA's can also

particularly osteoarthritis or rheumatoin arthritis. The ENA's can also

be used to treat antigen presenting cells of a donor to induce tolerance

con a alloantigen of a donor. They can also be used for

containing allergies and other inflammatory conditions. The ENA's can also

ce be used in diagnosis. Ribozyme therapy impacts on the expression of

stromelysin without introducing the non-specific effects upon gene

contential in without introducing the non-specific effects upon gene

contential that required of antisense molecules, and is highly

contential than that required of antisense molecules, and is highly

contential than that required of antisense molecules, and is highly

contential than that required of antisense molecules, and is highly

94US-00354920

The present invention describes a novel enzymatic nucleic acid (ENA)

having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues

(ii) a 2'-C-ally1 modification at position 4 of the ENA; (iii) at least

ten 2'-O-methy1 modifications; and (iv) a 3'-end modification. The ENA's

can inhibit collagenase and stromelysin production in the synovial

membrane of joints for the treatment or prevention of arthritis,

particularly osteoarthritis or rhemmatoid arthritis. The ENA's can also

be used to treat antigen presenting cells of a donor to induce tolerance

in a recipient to an alloantigen of a donor. They can also be used for

chancing graft tolerance or for treating autoimmune disease, and for

treating allergies and other inflammatory conditions. The ENA's can also

be used in disquosis: Ribozyme therapy impacts on the expression of

stromelysin without introducing the non-specific effects upon gene

expression which accompany treatment with retinoids and dexamethasone.

The concentration of ribozyme required to affect a therapeutic treatment present invention

is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the

The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues ; (ii) a 2.'-callyl modification at position 4 of the ENA; (iii) at least ten 2'-c-methyl modifications; and (iv) a 3'-end modification. The ENA; can inhibit collagenase and stromelysin production in the symovial membrane of joints for the treatment or prevention of arthritis; particularly osteoarthritis or rheumatorid arthritis. The ENA's can also be used to treat antigen presenting cells of adonor to induce tolerance enhancing graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of the communication of a donor to induce to the complex of the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the Example 1; Page 154; 307pp; English. present invention

Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fil-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (fik-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rhematoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                      Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; thermour angiogenessis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human flt1 VEGF receptor hammerhead ribozyme substrate #1157.
                                                     Mouse flt-1 VEGF receptor hammerhead ribozyme substrate #130.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3.9%; Score 11.2; DB 1; Length 17; 56.2%; Pred. These sequences, and the phosphorothioate oligonucleotides represented by AAT12418-T12434 (which are complementary to regions of the mRNA 4 or 5 of herpos simplex virus 1 (HSV)), are effective in the prevention and treatment of viral infection. The sequences are especially effective against infection by HSV, HIV or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antiviral phosphoro:thioate oligo:nucleotide(s) - active against e.g. herpes simplex virus 1, HIV and varicella zoster virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                              The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fl-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                            Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.

synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fifth-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression of nucleic acid molecules from the present specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                        mRNA
                                                                                                                                                                                                                                           The present invention describes nucleic acid molecules which modulate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR; primer; amplify; polymerase chain reaction; haematopoietic cell; chronic myelogenous leukaemia; human; bcr2-abl2; translocation region; cytogenetic remission; Ph chromosome; bcr3-abl2; CML cell; acute lymphotrophic leukaemia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detection of chronic myelogenous leukaemia cells - by amplification of

the invention. AAP191759 can also be used as capture oligomucleotides (ON), while AAP19759 can also be used as capture oligomucleotides (ON), while AAP19760-T93763, AAP191791 and AAP19792 can also be used as detector agents. The method of the invention is for also be used as detector agents. The method of the invention is for detecting or monitoring chronic myelogenous leukaemia (CML) cells in a human patient. The method comprises obtaining RNA from haematopoietic channer be bordered amplifying it using a pair of primers that amplify both the borderable and borderable translocation regions. The amplify both the borderable and borderable translocation regions. The capture is contracted with a capture mixture. The capture ON is Specific for the bridging ligand to form a capture mixture. The capture on it capture applied to a receptor specific of the binding ligand. The solid phase coupled to a receptor specific of the binding ligand. The solid phase is washed, then contacted with a chector agent comprising a detector on specific for the borderable or correlated of the presence of cheector agent comprising a detector on specific for the borderable of the patient. The method is to detect or capture the solid phase is then correlated with the presence of questive and the borderable and the and AAT91765-T91792 are primers used in the method of from haematopoietic cells with primers for the bcr2-abl2 and bcr3-Claim 6; Page 12; 79pp; English abl2 trans-location regions.

Enzymatic nucleic acid molecules which specifically cleave RNA derived

; The present invention describes an enzymatic nucleic acid molecule which specifically cleaves RNA derived from a c-fos gene. AAV95401 to AAV95540 and AAV95541 to AAV95544 tepresent hammerhead tibozymes and hairpin ribozymes, respectively, which specifically cleave human c-fos. AAV95261 to AAV95400 and AAV95585 to AAV95628 represent human c-fos target cancer associated with concleic acid molecules can be used for treating cancer associated with elevated levels of c-fos oncogene, especially leukaemias, neuroblastomas and lung, breast and colon cancers. The tibozymes may also be used as diagnostic tools to examine genetic drift and mutations within diseased cells, or to detect the presence of c-fos RNA in a cell from a c-fos gene - useful for treating conditions related to levels of -fos, especially cancer. Treating respiratory disease with antisense sequences directed against adenosine or bradykinin receptors - with localised delivery to the respiratory system, suitable for long term treatment of asthma, adult respiratory distress syndrome etc.

Claim 12; Page 8-24; 47pp; English.

Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the

human adenosine Al receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they protein coupled family of cell surface receptor is a member of the Gransmembrane segments. These oligonucleotides can be used to treat or prevent conditions associated with bronchoconstriction and/or lung inflammation in humans or other animals e.g. asthma, pulmonary disease, allergy, emphysema and cystic fibrosis

Treating respiratory disease with antisense sequences directed against adenosine or bradykinin receptors - with localised delivery to the respiratory system, suitable for long term treatment of asthma, adult respiratory distress syndrome etc.

Claim 12; Page 8-24; 47pp; English.

Sequences AAV46501-V47446 are anti-sense oligonuclectides that target the human adenosine Al receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary

ö structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothicate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-protein coupled family of cell surface receptors that have 7-transmembrane segments. These oligonucleotides can be used to treat or prevent conditions associated with bronchoconstriction and/or lung inflammation in humans or other animals e.g. asthma, pulmonary disease, allergy, emphysema and cystic fibrosis Gaps ; Length 17; 3; Indels Sequence 17 BP; 6 A; 1 C; 8 G; 2 T; 0 U; 0 Other; 3.9%; Score 11.2; DB 1; 11.2%; Pred. Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for treating cancers.

Claim 5; Page 73; 109pp; English.

which specifically cleave RNA derived from an epidermal growth factor receptor (BGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090 to represent specifically claimed target sequence from human BGF-R. AAV98044 to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human BGF-R. The NAMs are useful for cleaving BGF-R RNA in the treatment of a condition associated with BGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell The present invention describes enzymatic nucleic acid molecules (NAMS)

                                                                                                                         AAV96514/
```

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity (e.g. ribozymes) which are capable of modulating the expression of plant genes: (i) involved in biosynthesis of alkaloids; or (ii) involved in flower formation. AAV95982 to AAV96334, and AAV96335 to AAV9634 represent potato solanidine glucosyltransferase hammerhead and carrier ribozymes, respectively. AAV95629 to AAV95931, and AAV96335 to AAV96734 represent potato solanidine glucosyltransferase target sequences. AAV96773 to AAV97170, and AAV97171 to AAV97195 represent potato colrate synthase hammerhead and hairpin ribozymes, respectively. AAV96735 to AAV96772, and AAV97196 to AAV9720 represent potato citrate synthase target sequences. Ribozymes of the present invention can be used to inhibit the synthesis of towarc alkaloids in solanaceous plants, particularly potato but also tomato, pepper, aubergine and ditura or connibit the synthesis of towarc particularly cotato but also tomato, pepper, aubergine and ditura or connibit the synthesis of connect, turnip, sweet potato and turf grass. Also the ribozymes can be used for RNA manipulation in the same carrier restriction endomucleases are for DNA, as well as to examine way that restriction endonucleases are for DNA, as well as to examine genetic drift and mutations in plants and to detect specific RNA. The ribozymes can be targeted to specific genes or to consensus sequences within a family of related genes, and being catalytic need to be present very low concentrations only

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity (e.g. ribozymes) which are capable of modulating the expression of plant genes: (i) involved in biosynthesis of a HARAloids or (ii) involved in flower formation. AAV95982 to AAV96334, and AAV96335 to AAV96344 represent potato solanidine glucosyltransferase hammerhead and hairpin ribozymes, respectively. AAV95629 to AAV95931, and AAV96355 to AAV96734 represent potato solanidine glucosyltransferase target contracts synthase hammerhead and hairpin ribozymes, respectively. CC potato citrate synthase hammerhead and hairpin ribozymes, respectively. AAV96735 to AAV96772, and AAV97170, and AAV97171 to AAV97195 represent potato citrate synthase target sequences. Ribozymes of the present invention can be used cynthase target sequences. Ribozymes of the present invention can be used to inhibit thowering in potato. Detect spinach, cabbage, brussel sprouts, controlarly potato but also tomato, pepper, aubergine and ditura or to inhibit thowering in potato. Lettuce, spinach, cabbage, brussel sprouts, crugular kale, collards, cerv, letture, spinach, cabbage, brussel sprouts, crugular kale, collards, beet, turnip, sweet potato and turf crugals. Also the ribozymes are for DNA, as well as to examine way that restriction endonucleases are for DNA, as well as to examine cribozymes can be targeted to specific genes or to consensus sequences within a family of related genes, and being catalytic need to be present crucy at only very low concentrations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ó
                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (II)-2R gamma encoded RNA. AAV93889 to AAV94574 represent specifically claimed ribozymes, and AAV94575 to AAV95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce
                                                                                                                                                                                                                                                                                                                                                             Ribozymes targetted to interleukin 2 - useful for treating e.g. cancer, autoimmune disease and allergies.
                                                                                                                                                 Human, IL-2 receptor g-chain; interleukin 2 receptor gamma chain;

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl content an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16755 to AAA191561 to AAA17621 to AAA17621 to AAA19155 and AAA11685 and AAA19187 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19185 to AAA19187 to AAA19221 represent their corresponding target sequences; AAA19223 to AAA21681 represent their corresponding target sequences; AAA19223 to AAA21681 represent their corresponding target sequences; AAA21689 to AAA21681 represent their corresponding target sequences; AAA21689 to AAA21683 represent their corresponding target sequences; AAA21689 to AAA21683 represent their corresponding target sequences; Corresponding targe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel ribozymes for modulating the synthesis, expression and/or stability

Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.

Claim 53; Page 79; 305pp; English.

Novel ribozymes for modulating the synthesis, expression and/or stability

of an mRNA encoding an angiogenic factors. Claim 54; Page 224; 305pp; English.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA1675 to AAA1762 represent ribozyme sequences for AAA1767 to AAA1762 to AAA1762 to AAA1763 to AAA1763 to AAA1763 to AAA1763 to AAA1763 to AAA1763 to AAA1968 to AAA1968 to AAA1968 sequences; AAA19154 represent ribozyme sequences for Tie-2, and AAA19155 to AAA1908 and AAA1915 to AAA1915 and AAA21801 to AAA2189 to AAA2180 and AAA2180 to AAA2180 and AAA2180 to AAA2180 and AAA2180 to AAA2180 to AAA2180 to AAA2180 to AAA2180 to AAA2180 and AAA2180 to AAA2180 to AAA2180 and AAA2180 to AAA2180 to AAA2180 and AAA2280 to AAA2180 to AAA2180 to AAA2180 to AAA2180 and AAA2280 to AAA2180 to AAA2180 to AAA2180 to AAA2180 to AAA2280 to AAA2280 and AAA2280 to AAA2280 and AAA2280 to AAA2280 to AAA2280 to AAA2280 to AAA2280 and AAA2280 to AAA2280 to AAA2280 and AAA2280 to AAA2280 and AAA2280 to AAA2280 and AAA2280 to AAA2280 and AAA2280 to AAA2280 to AAA2280 and AAA2280 to AAA280 to AAA2280 to AAA2280 to AAA2280 to AAA2280 to AAA2280 to AAA280 to AAA2280 to AAA280 to AAA280 to AAA280 to AAA280 to AAA280 to AAA280 to A stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3

Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.

Claim 56; Page 117; 305pp; English.

The present internation describes engiged.

Cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARWT) gene, an integrin subunit beta 3 gene, an integrin subunit beta 3 dene, an integrin subunit beta 3 dene, an integrin subunit beta 3 dene, and AAA17163 to AAA1762 represent ribozyme sequences for ARA18385 and AAA1987 to Corresponding target sequences; AAA17681 to AAA18385 and AAA1987 to Corresponding target sequences; AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA1987 to AAA19122 represent their corresponding target sequences; AAA19122 to AAA21561 to AAA11561 to AAA21561 to AAA21562 to AAA21560 and AAA21689 to AAA21689 represent their corresponding target sequences; AAA21689 to AAA21689 represent their corresponding target sequences for integrin alpha 6 subunit, and AAA23362 to AAA23343 to AAA22475 and AAA22475 to AAA23342 represent ribozyme soft for integrin subunit beta 3, and AAA23476 to AAA23362, AAA23343 to Corresponding target sequence for integrin subunit beta 3, and AAA2476 to AAA23362, AAA23343 to the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, corresponding of tuberous scleeneration, psoriasis, verruca vulgaris, and ottuberous and diseases related to the syndrome, Kippel-Trenaunay-Weber schale to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ANA1900. present invention describes enzymatic nucleic acid molecules with RNA integrin subunit alpha-6, or integrin subunit beta-3

Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.

Claim 55; Page 203; 305pp; English.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARMT) gene, an integrin alpha 6 subunit gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA1761 and AAA17621 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17623 to AAA17684 represent their corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to AAA19155 to AAA19223 to Expresent their corresponding target sequences; AAA1665 to AAA18386 and AAA19086 to AAA1923 to AAA1923 to AAA1923 to AAA19250 to Expresent ribozyme sequences; for Tie-2, and AAA18386 to AAA19086 sequences; for integrin alpha 6 subunit, and AAA20362 to AAA21500 and AAA21596 to AAA21688 represent their corresponding target sequences; AAA21699 to AAA22475 and AAA22476 to AAA3342 represent riboxyme sequence for integrin subunit beta 3, and AAA22476 to AAA23262, AAA2343 to AAA2242 represent their corresponding target sequences. The riboxymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related meacular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A method has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases
                                                                                                                                                                                                                                                                                                                                                                                                                    Human, c-raf, A-raf, B-raf, hammerhead ribozyme, hairpin ribozyme, target; substrate; catalyst; modulation; expression; Raf gene; delivery; screening; identification; synthesis; deprotection; purification; cancer; inflammation; psoriasis; non-hepatic ascites; infection; genetic drift; restenosis; rheumatoid arthritis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying new catalytic nucleic acid that modulates selected processes especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons.
syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3
                                                                                                                                      Gaps

caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are
                                                                                                                         used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity, AAV90922 to AAV9387 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, c-raf, A-raf, B-raf, hammerhead ribozyme; hairpin ribozyme; bushstate, catalyyst, modulation, expression; Raf gene, delivery, screening, identification, synthesis; deprotection, purification; cancer, inflammation, psoriasis; non-hepatic ascites; infection; genetic drift;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates
                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bellon L;

a random sequence, and a catalytic dowain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with cendonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to clave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine c-raf RNA. Specifically NACs with RNA-clearing activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or cused to treat condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stlavily any condition accordated with the level of c-raf. Introduction of sugar/phosphate modifications increases stlavily, and sainst nuclease and activity. AAV90922 to AAV303877 represent NACs that can be used in the conditionally for modulating the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; c-raf; A-raf; B-raf; hammerhead ribozyme; hairpin ribozyme;

capable of modulating a process in a biological system. The method acid catalysts (NAC) having a bubstrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (B) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases assensed by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic acides and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                           used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease activity. AAV99922 to AAV93877 represent NACs that can be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense oligonucleotide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;
                                                                                                                                                                                                                                                                                                                                                                                       activity. AAV90922 to AAV93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                    A method has been developed for the identification of a nucleic acid

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, coding and
condons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
end and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5512-74. These multiple target oligonucleotides
conditions or mixtures. Typical diseases and conditions are those
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
diseases, pulmonary vasoconstriction, inflammation, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, pancer, metastases, as
well as all types of cancers which may metastasize or have metastasized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

Delivering tissue kallikrein and atrial natriuretic peptide to a cell for prevention and treatment of non-hypertension-associated renal and cardiac disorders.

Example 1; Page 111; 120pp; English

This invention describes a novel method for delivering tissue kallikrein and atrial natriureric peptide to a cell which can be used in the treatment of non-hypertension-associated renal and cardiac disorders. Non hypertension-associated renal disorders include renal injury, nephrotoxicity, nonhypertension-associated renal disease, salt-induced

renal damage, chronic renal failure, nephrotic syndrome and diabetic cardiac hypertension-associated cardiac disease, heart failure after cardiac uspertension-associated cardiac disease, heart failure after cardiac surgery, cardiac injury after myocardial infarction, myocardial ischemia, congestive heart failure and restenosis following angioplasty. The encoding nucleic acids can also be used for preventing and or treating the following: cerebrovascular disorders, injury caused by drug induced and/or salt induced nephrotoxicity and chronic renal failure and inhibiting vascular smooth muscle cell growth and/or inhibiting neointimal formation in blood vessel and stimulating
glomerulosclerotic lesions, tubular injury, drug-induced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  renal tubular regeneration and/or reversing pre-existing renal injury

Delivering tissue kallikrein and atrial natriuretic peptide to a cell for prevention and treatment of non-hypertension-associated renal and cardiac disorders.

Example 1; Page 70; 120pp; English.

This invention describes a novel method for delivering tissue kallikrein and atrial natriuretic peptide to a cell which can be used in the treatment of non-hypertension-associated renal and cardiac disorders. Non-hypertension-associated renal disorders include renal injury, nephrotoxicity, nonhypertension-associated renal disease, salt-induced renal damage, glomerulosolerotic lesions, tubular injury, drug-induced renal damage, chronic renal failure, nephrotic syndrome and diabetic

Yeast genomic DNA was used as template. The PCR product was used in the construction of a pdr12::hisg-URA3-hisG deletion plasmid. Constitutive overexpression of the PDR12 gene in yeast cells confers increased resistance to weak acids such as sorbate, propionate and benzoate, used e.g. as preservatives in foods and beverages. The invention provides a transformed yeast strain that constitutively expresses a gene encoding a weak acid pump. The yeast cells can be used for the production of a dough or bread product (claimed), and for the production of an alcoholic beverage (e.g. whisky, wine, or been) or other fermented product (claimed)
            cardiac hypertrophy, nonhypertension-associated cardiac disease, heart failure after cardiac surgery, cardiac injury after myocardial infarction, myocardial ischemia, congestive heart failure and restenosis following angiophasty. The encoding nucleic acids can also be used for preventing and or treating the following: cerebrovascular disorders, preventing and or treating the following: cerebrovascular disorders, injury caused by disorders e.g. restenosis, renal damage and/or renal injury caused by drug induced and/or salt-induced nephrotoxicity and chronic renal failure and inhibiting vascular smooth muscle cell growth and/or inhibiting neointimal formation in blood vessel and stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     weak acid pump; yeast; ABC transporter; leavening; gassing power; bread; dough; alcoholic beverage; wine; beer; brewing; whisky;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a PCR primer for DNA encoding the human integrin cell surface receptor subunit beta6 (I) of the invention. (I) is involved in adhesion of cells with each other and with extracellular matrix. Increased expression of (I), or preventing binding by (I), is used to modulate cellular adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New human integrin cell surface receptor subunit beta-6, modulator of

This is the nucleotide sequence of a Thr(ACA) tRNA probe. 22 tRNA probes (see AAX07017-38) are provided, each being specific for a particular isoacceptor transfer RNA. They were used to determine the relative bundance of tRNA species in undifferentiated and differentiated mouse keratinocytes. tRNAs can be extracted from a cell or tissue, fixed to a solid support and used in Mybridisation experiments with the tRNA probes. Results showed that tRNAs specific for Ala(GCA), Leu(CTY) and Leu(CTA) and Leuc(TTA) are increased in differentiated cells, while tRNAs or Arg(CGA), Pro(CCI) and Asn(AAA) were more abundant in undifferentiated experimency tes. The invention arises from the discovery that the relative abundance of different isoaccepting tRNAs varies in different cells or tissues, or in calls and tissues in different sates of differentiation or in different cogether with the codon composition of a gene to regulate and direct expression of a protein to a particular cell or tissue, or to a cell or tissue in a specific state of differentiation or in a specific stage of the cell cycle. This is particularly useful for gene therapy and for the choice of production of virus particules in cycling eukaryotic cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
               Synthetic nucleic acid with at least one codon replaced by a synonym for producing viral particles and in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; adenosine receptor; low adenosine antisense oligonucleotide; phosphorothioate; impaired respiration; inflammation; allergy; allergic disease; bronchoconstriction; inhibitor; antiinflammatory;

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets coligonucleotide acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic associated with inflammation, impaired airways, including lung diseases associated with inflammation, impaired airways, including lung diseases and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating ciffects afflict the lungs of a subject. They can be used for treating impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, archinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the CONs reduces side effects. The A-containing ONs break down with the content of the containing on the adenosine content of the containing of the adenosine content of the con bronchoconstriction and inflamation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA3392) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention. On the with their corresponding SEQ ID NO: sequences given in the sequence

The present invention describes a gene (I) encoding a ribozyme prodrug comprising an intervening sequence removable by splicing, and/or lacking KNA-cleaving activity. Also described are: (1) an expression vector comprising (I) and preferably further comprising a tissue-specific promoter; (ii) a ribozyme prodrug comprising a tissue-specific comprising (I) and preferably further comprising a tissue-specific cortivity; (iii) a drug composition comprising (I); and (iv) the in vivo cortivity; (iii) a drug composition comprising (I); and (iv) the in vivo production of mature ribozyme with RNA-cleaving activity by introducing (I) into a eukaryote. (I) has antiviral, cytostatic, antiallargic and immunosuppressive activities, and can be used in ribozyme and gene (I) into a eukaryote. (I) has antiviral, cytostatic, antiallargic and immunosuppressive activities, and can be used in ribozyme and gene cortivates, and hepatitis C virus (HCV), cancers including therapy. The ribozyme prodrug is useful e.g. in gene therapy, cortivers and hepatitis C virus (HCV), cancers including those of the liver, pancreas and colon, and leukaemia, and diseases consed by genetic defects such as allergy, autoimmune diseases, familial genetic diseases and primary genetic diseases. The ribozyme prodrug, without RNA-cleaving activity, is encoded by a gene with an intervening content and primary propersed to a gene with an intervening content and primary propersed by gene which can be spliced of fin cytoplasm contents.
                                                                                                                               Novel ribozyme prodrug without RNA-cleaving activity, for use e.g. gene therapy to treat viral infections, cancers and diseases due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 17 BP; 1 A; 8 C; 4 G; 0 T; 4 U; 0 Other;

The present invention describes a pharmaceutical composition, comprising at least one agent (1) that prevents, alleviates and/or inhibits at least one agent (1) that prevents, alleviates and/or inhibits.

C(1) is an adenosine A2a receptor agonist (1a), or an oligomucleotide genes or corresponding RNA, to genomic flanking regions (1.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a, A2b or A3 agonist activity or A2a antagonist activity (or at least no agonist activity or A2a antagonist activity (or at least no agonist activity or A2a antagonist activity (or at least no agonist activity or A2a antagonist activity (or at least no agonist activity or this receptor). (1) may be a mixture of (1a) and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine compositions are used to prevent, alleviate and/or treat adenosine compositions are used to prevent, alleviate and/or renal damage or failure receptor-mediated cardiac, lung and/or renal damage or failure supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive pulmonary disease; cardiopulmonary hypoxia associated with administration of stress test agents, particularly where such conditions are associated with acute inflammation. AAA02719, AAA02721 and AAA02723 to oligomucleotides for use in the composition of the present of the present of the prevent condition of the condi

The present invention describes a pharmaceutical composition, comprising at least one agent (1) that prevents, alleviates and/or inhibits adenosine mediated cardiopulmonary and/or renal damage and/or failure.

(1) is an adenosine Aza receptor agonist (Ta), or an oligonoteotide genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all has Al, Azo or Az agonist activity or Aza antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia) and (Ib), and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine receptor-mediated cardiac, lung and/or renal damage or failure (particularly where associated with ischaemia, toxin release and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        administration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsies); allergic rhinitis; chronic obstructive pulmonary disease; cardiopulmonary hypoxia associated with administration of stress-test agents, particularly where such conditions are associated with acute inflammation. Claim 14; Page 112; 1592pp; English.

The antibense oligoniclectides and (1) can be used to down-regulate the expression and or activity of target polypetides associated with lung/respiratory disorders and malignancies, such as stimulating and cacivating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, and their transcription factors, chemokines, endogenously produced specific and non-specific enzymes, chanding proteins, adhesion molecules and their receptors, cytokines and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system creceptors, and peripheral nervous and non-nervous system creceptors, binding proteins and malignancy associated proteins. The carismanse oligoniclectides and antismatical interest of the factors and/or bronchoconstruction and/or lung inflammation, allergy (ies) and/or and/or bronchoconstruction (especially pulmonary obstruction and/or lung inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasoconstruction, inflammation, allergies, pain, cystic fibrosis (CR), allergic thinitis (RR), pulmonary condition, ephysema, chronic obstructive pulmonary disease (COPP), pulmonary transplantation rejection, pulmonary infections, bronchitis, candyor cancer. AAFIB434 to AAFZ1543 represent human polynucleotide The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiniflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the fragments and antisense oligonucleotides used in the exemplification of

Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.

Claim 14; Page 113; 1592pp; English.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with cardivaling peptide factors and malignancies, such as stimulating and cardivaling peptide factors and transmitters, cranscription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system (CNS) and peripheral nervous and non-nervous system creceptors, defensins, growth factors, vasocative peptides and receptors, binding proteins and malignancy associated proteins. The ransmitters, defensins, growth factors, vasocative peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction) and/or lung inflammation, allergies, asthma, impeded respiratory vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory disease or condition selected from pulmonary vasoconstriction, inflammation, hypertension, emphysema, chronic obstructive pulmonary disease (CDD), pulmonary transplantation rejection, pulmonary undertions, bronchitis, and/or cancer. AAF18434 to AAF1543 represent human polynucleotides in the present invention

This introduction describes a movet use of institution describes a movet use of institution describes a movet use of institutions of lactobacillus delbrueckii (II) or Lactobacillus helveticus (III). (I) are used as tools for genetically modifying the genome of (III) and (III). This has applications in screening experiments to identify relevant genetic functionalities, for integration experiments or for gene expression onto the bacterial genome of (II) or (III). (II) and (III) are used for the preparation of a fermented product, secondary metabolites, betacory alactosidase, cell wall protease, catabolite control protein A, lactate dehydrogenase, glycosyltransferase, a restriction system, a lysogenic corpopatage or the permesse of the lac operon, where the gene is inactivated by insertion of at least 1 IS element. (I) are also useful for gene tagging, gene inactivation and integration and/or gene expression on a plasmid and/or genomic level. Prior art IS elements were not used for codifying Lactobacillus, as this species, used for yoghurt production, were difficult to modify. (I) provide new genetic tools for Lactobacillus species which are used for many processes such as gene tagging, unlike prior art lactobacilli IS elements, which are very limited. The modified prior art lactobacilli IS elements, which are very limited. The modified

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primers AAZ61023-24 were used to amplify a probe (AAZ61024) which is used to isolate Zea mays delta9-desaturase DNA. The specification describes a construct encoding an antibody that can bind a transit peptide that directs an associated passenger protein to a plant cell organelle. The transit peptide sequence of the maize stearoyl-ACP- delta9-desaturase (delta9-desaturase) was determined, and used to produce antibodies of the invention. These antibodies were produced in transgenic plants of the invention. The constructs of the invention are useful for producing antibodies which decrease steady state levels of passenger proteins in the organelles of plant cells and plants, by binding to the transit peptide. This results in the production of transgenic plants which have altered steady state passenger protein levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel nucleic acid construct for down-regulating steady state levels of proteins in plant cells, transgenic plants and their progeny.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1491.

with a target sequence and contain at least one phosphoro(di)thicate
link, having endonuclease activity. (A), and more generally any catalytic
uncleic acid (A) that medulates expression of the oestrogen receptor
gene, are used to treat cancer (particularly of breast or endometrium),
in vivo or by transforming cells ex vivo and implanting treated cells, or
for other conditions associated with levels of oestrogen receptor.
Because of the high selectivity for targeted RNA, (A) can also be used
correlate inhibition of gene expression with alterations in phenotype,
particularly for identification of therapeutic targets, and as research
reagents (for RNA, in the same way that restriction endomucleases are
used with DNA). The combination of modifications in (A) improves
tesistance to nucleases, binding affinity and/or activity. AAA23503 to
AAA24748 to AAA25092 represent their corresponding target sequences.
AAA25095 represent cestrogen receptor hammerhead ribozyme sequences.
AAA26105 represent cestrogen receptor hatroin ribozyme
sequences, and AAA26107 to AAA2621 represent their corresponding target
sequences and AAA26107 to AAA2621 represent their ribozyme sequences and
antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucleic acids that interact, and optionally cleave, target sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes nucleic acids (A) that interact stably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1506.
   Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead ribozyme; claavage; hammerhead ribozyme; chairpin ribozyme; antisense oligonucleotide; gene expression modification; cancer; phosphorothioate; endonuclease; anticancer; breast cancer; endometrium cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
